N8N CRUD Verification Workflow

Assessment evidence | API operations using ReqRes mock API | 27 October 2026

Objective

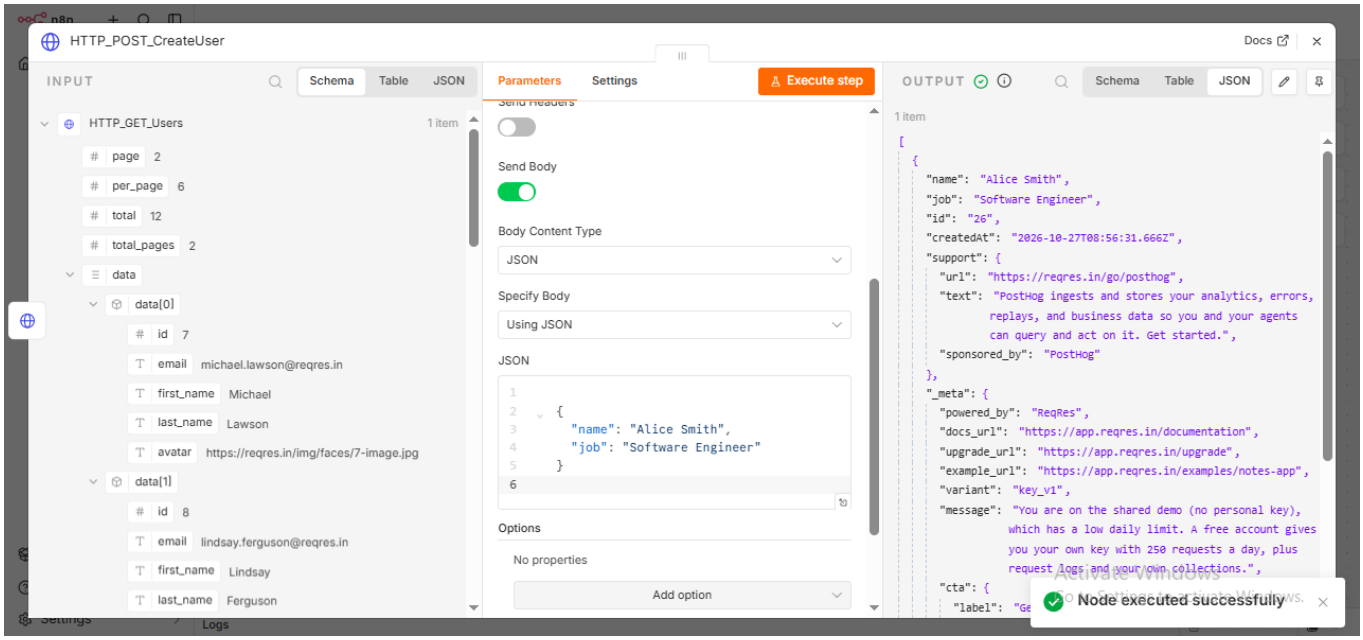

Demonstrate GET, POST, PUT and DELETE requests in one n8n workflow, and capture the successful node outputs and end-to-end execution.

Evidence 1 - GET users

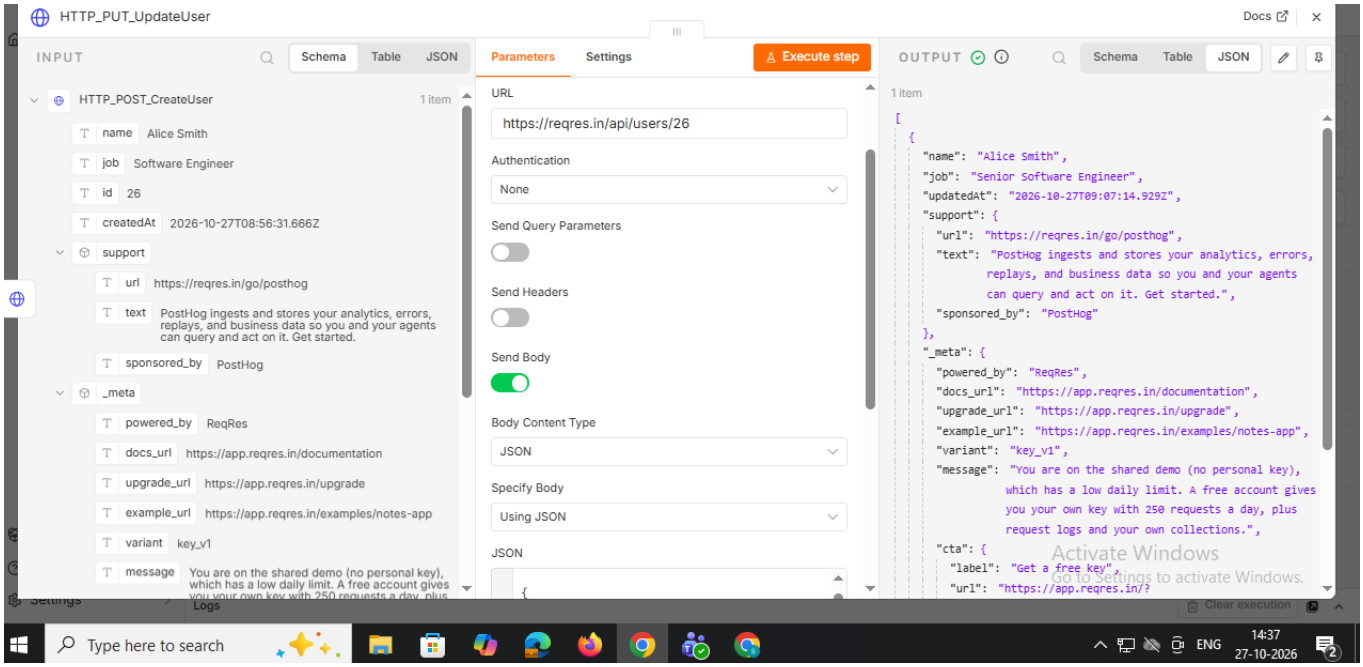

The GET request retrieves page 2 of the ReqRes user list. The response includes user records and pagination details.

Evidence 2 - POST create user

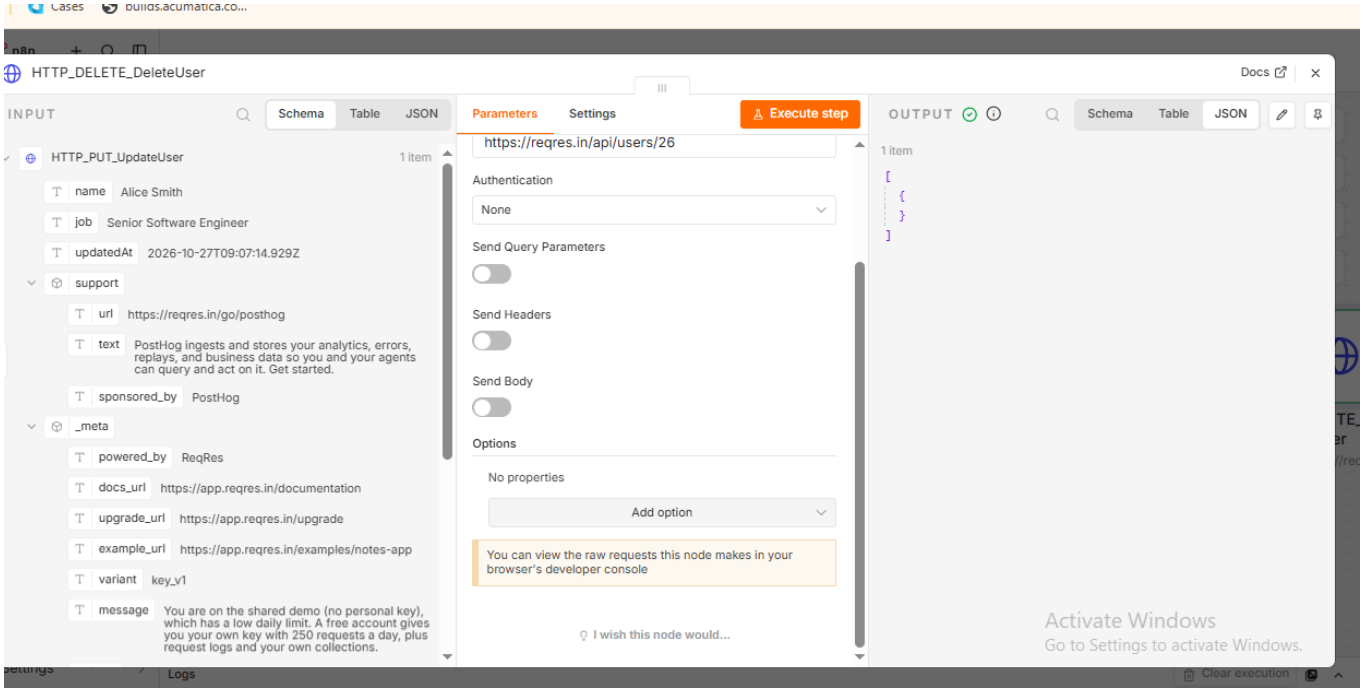

The POST request submits Alice Smith with the job Software Engineer. The mock API returns an ID and creation timestamp.

Evidence 3 - PUT update user

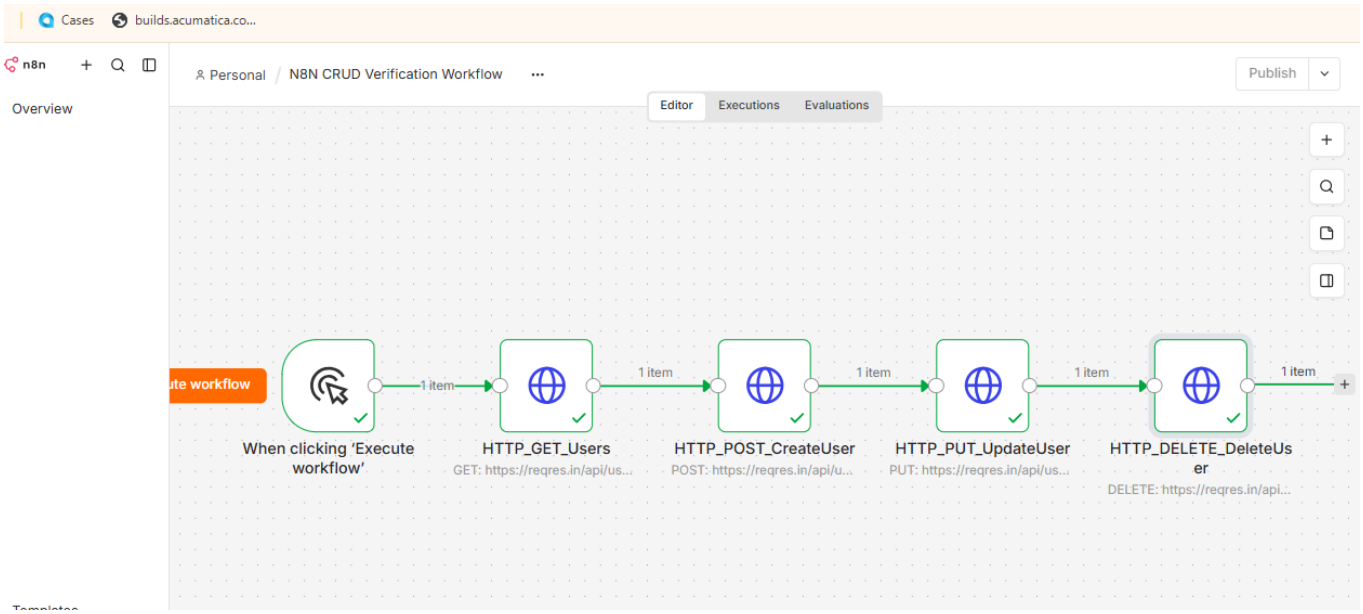

The PUT request targets user ID 26 and returns the updated job Senior Software Engineer with an update timestamp.

Evidence 4 - DELETE user

The DELETE request targets user ID 26 and completes successfully. The response body is empty, represented by an empty JSON object in n8n.

Evidence 5 - Complete workflow run

The final n8n canvas shows the Manual Trigger followed by GET, POST, PUT and DELETE nodes. Every node has a green success checkmark.

Execution summary

The captured run shows successful execution of all four HTTP Request nodes. ReqRes is a mock service; these results demonstrate request and response handling, not persistent creation, update or deletion of a database record.
